Who We Are

We are a **technology enterprise** with a social vocation: for 30 years it has been **designing and managing online services in the socio-health sector**, for public and private clients. These are a few keywords to sum up the company's know-how and mission:

- **Patient/ambient/active assisted living**: integrated services for remote assistance, first aid and domotics
- **Telecare**: remote monitoring and telemedicine services
- **Patient chronic care: monitoring** – follow up of users “at risk”
- **Active aging & patient engagement**: services for active ageing, from mobile remote safety to networking with services and opportunities at local level, tele-coaching for health

All of this is done **by means of inter-services integration and the application of specific processes involving technologies** (*patient-device-operator*).

Project idea

The project involves the **management of a housing aimed at hosting fragile users, though self-sufficient, who wish to maintain their own active living autonomy** within a structured context to guarantee their assistance and support needs.

The general objective of the project is to **contribute to improving the psycho-physical well-being of the residents.**

More specifically, the project provides for the **supervision of the structure by professional figures**, residing on site, with assistance to the person and domicile, **home technologies** to monitor the well-being of residents and manage any emergencies (teleassistance and environmental sensors and/or telemedicine and telemonitoring parameters), and social management activities (**social housing**), among others.

Looking for

Our enterprise is looking for a **specialized partners** on the development of innovative **ICT technologies/solutions monitoring fragile people at home and preventing a deterioration of their health**, especially in chronic conditions.

The final goal is thus **the direct or indirect implementation (also in) of other innovative services/interventions/performances/technologies** for the final users (and for institutions with which Televita is working), to creating an actual Expanded Chronic Care Model in our housing project. Today, such a model – in the socio-health sector – can be expected to result in a promising integration between activities for prevention and promotion of health at community level and for chronic disease management.
